

# THE FUTURE is HERE TODAY

Compact Power Unit includes video connections to overlay engine, stage and blade information onto the signal from a video borescope. Software upgrades are made via the Power Unit's built-in USB port.

The entire package (including case and cables) weighs only 21 pounds.

The video overlay is especially useful if a recording is made of the inspection (simulated video picture).

Wireless and wired Hand Controls are available; wireless model can be used with or without cable.

Manual, blade-by-blade or completely automated inspections of each stage are possible. The operator has complete control of speed, delay, and blade position in the borescope. The new Drive Motor is light and compact.

Hand and foot switches can be connected to the Hand Control for remote operation
